# SCALE FOR PROJECT CPP MODULE 08 (/PROJECTS/CPP-MODULE-08)

You should evaluate 1 student in this team

★

Git repository

`git@vogsphere.42urduliz.com:vogsphere/intra-uuid-53b36898-c`    📋

---

## Introduction

- Only grade the work that is in the student or group's
GiT repository.

- Double-check that the GiT repository belongs to the student
or the group. Ensure that the work is for the relevant project
and also check that "git clone" is used in an empty folder.

- Check carefully that no malicious aliases were used to fool you
and make you evaluate something other than the content of the
official repository.

- To avoid any surprises, carefully check that both the evaluating
and the evaluated students have reviewed the possible scripts used
to facilitate the grading.

- If the evaluating student has not completed that particular
project yet, it is mandatory for this student to read the
entire subject prior to starting the defence.

- Use the flags available on this scale to signal an empty repository,
non-functioning program, a norm error, cheating etc. In these cases,
the grading is over and the final grade is 0 (or -42 in case of
cheating). However, with the exception of cheating, you are
encouraged to continue to discuss your work (even if you have not
finished it) in order to identify any issues that may have caused
this failure and avoid repeating the same mistake in the future.

- Remember that for the duration of the defence, no segfault,

no other unexpected, premature, uncontrolled or unexpected
termination of the program, else the final grade is 0. Use the
appropriate flag.
You should never have to edit any file except the configuration file if it exists.
If you want to edit a file, take the time to explicit the reasons with the
evaluated student and make sure both of you are okay with this.

- You must also verify the absence of memory leaks. Any memory allocated on the heap must
be properly freed before the end of execution.
You are allowed to use any of the different tools available on the computer, such as
leaks, valgrind, or e_fence. In case of memory leaks, tick the appropriate flag.

# Disclaimer

Please respect the following rules:

- Remain polite, courteous, respectful and constructive
throughout the evaluation process. The well-being of the community
depends on it.

- Identify with the person (or the group) evaluated the eventual
dysfunctions of the work. Take the time to discuss
and debate the problems you have identified.

- You must consider that there might be some difference in how your
peers might have understood the project's instructions and the
scope of its functionalities. Always keep an open mind and grade
him/her as honestly as possible. The pedagogy is valid only and
only if peer-evaluation is conducted seriously.

# Guidelines

You must compile with clang++, with -Wall -Wextra -Werror
As a reminder, this project is in C++98 and C++20 members functions or containers are NOT expected.

Any of these means you must not grade the exercise in question:
- A function is implemented in a header (except in a template)
- A Makefile compiles without flags and/or with something other than clang++

Any of these means that you must flag the project as Forbidden Function:
- Use of a "C" function (*alloc, *printf, free)
- Use of a function not allowed in the subject
- Use of "using namespace" or "friend"
- Use of an external library, or C++20 features

# Attachments

subject.pdf (https://cdn.intra.42.fr/pdf/pdf/27287/en.subject.pdf)

# ex00

*As usual, there has to be a main function that contains enough tests to prove the program works as required. If there isn't, do not grade this exercise. If any non-interface class is not in Coplien's form, do not grade this exercise.*

### ex00

There is a templated function easyFind(T, int) that does what the
subject requires.
It HAS to use STL algorithms.
If it does not (Manual search using iterators for example), count it as wrong.

    ✓ Yes                                    ✕ No

# ex01

*As usual, there has to be a main function that contains enough tests to prove the program works as required. If there isn't, do not grade this exercise. If any non-interface class is not in Coplien's form, do not grade this exercise.*

### ex01

There is a class that respects the constraints of the subject.
Its member functions use STL algorithms to find their result, as much as possible.

    ✓ Yes                                    ✕ No

### Better addNumber

There's a way to add numbers that's more practical than calling addNumber
repeatedly.

    ✓ Yes                                    ✕ No

# ex02

*As usual, there has to be a main function that contains enough tests to prove the program works as required. If there isn't, do not grade this exercise. If any non-interface class is not in Coplien's form, do not grade this exercise.*

### ex02

There is a MutantStack class that inherits from std::stack (Or is
composed of one, dealer's choice), and offers all of its member functions.
It has an iterator, and it is possible to do at least the operations in the subject's

example with it.

⊘ Yes                                                             ✕ No

---

**Better tests**

There is a test main() function that has more tests than the one
in the subject.

⊘ Yes                                                             ✕ No

# Ratings

**Don't forget to check the flag corresponding to the defense**

✔ Ok                                            ★ Outstanding project

█ Empty work        💬 No author file        💀 Invalid compilation        ▤ Norme        ▧ Cheat        ☡ Crash

💧 Leaks                                        ⊘ Forbidden function

# Conclusion

**Leave a comment on this evaluation**
